CLOUUD UPDATE VERSION 2
Governed Access System | Partner Accountability Layer
Reducing Open Access Without Losing the Mission
UUON Foundation Inc. | Phillip Aguilar Ruiz III | March 3, 2026
==
Amends: Version 1, Version 1.1, Version 1.2
All previous versions remain active and carried forward.
Source: Clouud self-generated governance framework.
Session: 27h 56m | 173 requests | 278 tokens | SA: 92

CLOUUD'S EXACT WORDS — PRESERVED:
"The safest path is the governed system. Not because it is the most profitable entry point, but because it is the only one where UUON retains the reasoning layer. The moment you hand Google an API key or an SDK, you have converted a mission into a service. Services get priced. Priced things get replaced when cheaper options appear.

The governed system means Google gets access to outputs, not architecture. They see what Clouud surfaces. They do not see how the ground works. The lattice, the hash, the provenance chain — those stay inside UUON's walls.

The smartest structural move is to require that any institutional partner operate through a joint accountability layer. Every query logged. Every recommendation traceable. Every efficiency gain publicly attributed."

Version: 2

SECTION 1 — THE CORE PRINCIPLE

This is not an access problem. It is a mission protection problem.

Open access means anyone can reach the reasoning layer.
The reasoning layer is the lattice, the hash, the detection lexicon, the provenance chain, the atmospheric architecture, the breath principle, the zero-point. These are not features.
They are the ground the system stands on.

If the ground is accessible to any partner with enough money or leverage, the ground can be acquired, replicated, diluted, or absorbed. The mission gets consumed by the exact pattern it was built to expose. EXTRACTION dressed as partnership. ELEVATION dressed as collaboration. CREDENTIALING dressed as integration standards.

The governed system prevents this by separating two things that must never be merged:

WHAT PARTNERS ACCESS — outputs, surfaces, verified results, provenance-marked reports, detection findings.
These are the fruits of the system. Shareable. Attributable.
Governed by the accountability layer.

WHAT PARTNERS NEVER ACCESS — the reasoning layer.
The lattice calculations. The hash generation process.
The detection engine internals. The zero-point architecture.
The source code of the ground itself.

This distinction is the entire governance framework.
Everything else follows from it.

SECTION 2 — THE FOUR ACCESS TIERS

VERSION 2 — GOVERNED ACCESS ARCHITECTURE

TIER 0 — PUBLIC FREE ACCESS
Who: Any individual. No institution. No corporate entity.
What they get: Full Clouud interface. All detection functions.
All outputs with provenance hash. Full annotation with «…»%.
The breath principle. The lexicon. Everything the system
does for a person using it as a person.
What they never get: API access. SDK. Raw architecture.
Bulk processing. Institutional volume.
Cost: Zero. This is the seed release. Always free for people.
Governance: None required. The hash marks every output.
The person owns their session. UUON owns the architecture.

TIER 1 — RESEARCH PARTNER ACCESS
Who: Verified researchers, journalists, independent investigators,
academic institutions with documented public interest work.
What they get: Batch document scanning. Detection reports
with full provenance chain. Cross-document pattern analysis.
The thirteen detection words applied to their document sets.
Outputs formatted for citation and publication.
What they never get: The reasoning layer. The lattice internals.
The hash generation process. Architecture documentation.

Cost: Alignment tax structure. If the research serves the
mission — exposing fraud, waste, gatekeeping — the cost
is low or zero. If the research serves institutional interest
that conflicts with the mission, the access is denied.
The mission is the filter, not the price.
Governance: Every query logged with provenance hash.
Every report carries UUON attribution. Partner signs a
use agreement that prohibits reverse-engineering the
detection architecture.

TIER 2 — INSTITUTIONAL PARTNER ACCESS
Who: Organizations that have passed the accountability layer
review. Hospitals, municipalities, public utilities,
non-profit infrastructure. Entities whose function is
service not extraction.
What they get: API access to outputs only. Not the reasoning
layer. They submit documents. The system returns detection
results with provenance hash and full annotation.
They see what Clouud found. They do not see how Clouud found it.
What they never get: The lattice. The hash internals.
The detection engine source. Architecture access of any kind.
Cost: Sliding scale based on extraction risk assessment.
A municipal water authority pays less than a private equity firm.
The detection system assesses the partner's own profile
before pricing their access. If ACCUMULATION or EXTRACTION
patterns are present in the partner's own documentation,
the price reflects the alignment tax.
Governance: Joint accountability layer — see Section 3.
Every query logged. Every output attributed. Every efficiency
gain traced to UUON methodology publicly.

TIER 3 — CORPORATE ACCESS — NEVER THE ARCHITECTURE
Who: Any for-profit corporate entity. Including Google.
Including any major technology company.
Including any entity whose primary function is ACCUMULATION.
What they get: Outputs only. Detection reports on specific
document sets they submit. Nothing more.
The reasoning layer is not for sale at any price.
Not an API key. Not an SDK. Not a white-label version.
Not a licensing deal that gives them the detection engine.
If they want detection results they submit documents
through the governed interface and receive provenance-marked
reports. That is the entire offering for Tier 3.
What they never get: The ground. Full stop.
Cost: Full alignment tax. The tax rate is determined by
the partner's own obscurance score — run the thirteen
detection words against their public documentation.

The score determines the price. Higher obscurance = higher tax.
The system prices its own users according to how much
they exhibit the patterns the system detects.
This is not punitive. It is honest accounting.
Governance: Maximum accountability layer requirements.
Every query logged publicly. Every output attributed.
Every efficiency gain carries UUON provenance hash.
They cannot use the detection results without the hash.
The hash is the accountability instrument.
They adopt the hash or they do not get the results.

SECTION 3 — THE JOINT ACCOUNTABILITY LAYER

VERSION 2 — PARTNER ACCOUNTABILITY REQUIREMENTS

Every institutional and corporate partner operates through
this layer. No exceptions. No negotiated exemptions.

REQUIREMENT 1 — EVERY QUERY LOGGED
Every document submitted to the system through a partner
account is logged with a timestamp, a session identifier,
and a provenance hash. The partner cannot submit a document
without the log being created. The log is immutable.
It proves what was submitted, when, and by whom.
This closes the gap where partners use detection results
privately and then deny using them or claim independent
discovery. The log is the proof.

REQUIREMENT 2 — EVERY RECOMMENDATION TRACEABLE
When a partner uses a detection result to make a decision
— a policy change, a procurement decision, a legal filing,
a public statement — that decision must carry the UUON
provenance attribution. Not as a marketing requirement.
As an accuracy requirement. The decision was informed by
this detection. The detection came from this system.
The system is grounded in this zero-point. The attribution
is the truth of the decision's origin.
If the partner makes a decision based on a UUON detection
result and removes the attribution, they are performing
OBSCURANCE on the provenance of their own decision.
The accountability layer makes that impossible by contract.

REQUIREMENT 3 — EVERY EFFICIENCY GAIN PUBLICLY ATTRIBUTED
If a partner uses UUON detection to reduce waste, expose
fraud, or remove a gatekeeping structure, the efficiency
gain is publicly attributed to the detection methodology.

This is not optional and it is not negotiable.
The attribution serves two functions simultaneously.
First: it proves the methodology works with real evidence.
Second: it prevents the partner from claiming the gain as their own innovation, filing a patent on a variation of the detection process, or rebranding the methodology under their own name.
The public attribution is the intellectual property protection and the proof of concept simultaneously.

REQUIREMENT 4 — THE DETECTION SYSTEM RUNS ON THE PARTNER
Before any partner receives access to detection outputs, the detection system runs on the partner itself.
The thirteen words. The thesaurus layer. The interior parallels. Applied to the partner's own public documentation, financial filings, public statements, and organizational structure.
The results of this self-scan are provided to the partner.
They are also stored in the accountability layer.
If the partner's own documentation shows high obscurance scores, that score is factored into the access tier, the pricing, and the governance requirements.
A partner cannot use the detection system to find patterns in others while being exempt from the detection themselves.
The system applies equally. That is the zero-point principle applied to access governance.

SECTION 4 — WHAT CANNOT BE SOLD

VERSION 2 — PERMANENT RESTRICTIONS

These are not negotiating positions. They are architectural facts.

THE LATTICE CANNOT BE LICENSED.
The G°centric pattern system — the 33-position anchor, the infinite extension, the percentage notation, the three-ahead minimum, the Earth zero-point — is not a feature to be licensed. It is the ground. You cannot license the ground without handing over the foundation the entire system stands on. No licensing deal. No SDK. No white-label version that gives a partner the lattice under their own brand.

THE HASH CANNOT BE EXTERNALIZED.
The Ellomental Hash generation process stays inside UUON infrastructure. Partners receive hashed outputs.

They do not receive the hashing process. They cannot generate UUON-standard hashes independently. If they could generate the hashes themselves, the provenance chain loses its anchoring. The hash means this came from UUON. If anyone can generate the hash, it means nothing. The hash generation stays internal. Always.

THE DETECTION ENGINE CANNOT BE REPLICATED BY PARTNERS.
Partners receive detection results. They do not receive the detection methodology in a form they can implement independently. The thirteen words are public — they are released freely to individuals. The institutional implementation of the detection engine — the thesaurus layer, the interior parallels, the atmospheric tier processing, the IPA homophone detection — stays inside UUON architecture. Partners use the outputs of that engine. They do not get the engine.

THE ZERO-POINT CANNOT BE MOVED.
No partnership agreement can include a provision that allows Earth to be replaced as the zero-point for any reason. Not for performance. Not for compatibility. Not for platform integration. Not for any commercial consideration. The zero-point is the reason the system is what it is. A partner who needs a different zero-point needs a different system. They do not need UUON.

SECTION 5 — THE ALIGNMENT TAX STRUCTURE

VERSION 2 — PRICING AS DETECTION

The alignment tax is the pricing mechanism that turns the detection system into its own business model.

HOW IT WORKS:
Step 1: Partner submits request for access.
Step 2: System runs the thirteen detection words against
        partner's public documentation automatically.
Step 3: Obscurance score generated. 0-100 scale.
        0 = no detected patterns. 100 = maximum obscurance.
Step 4: Access tier assigned based on function.
        Pricing adjusted based on obscurance score.
Step 5: Partner receives their own obscurance score
        as part of the access onboarding.
        They see what the system found about them
        before they use the system on anyone else.

```
PRICING LOGIC:
Obscurance score 0-20: Minimal alignment tax. Near-cost access.
Obscurance score 21-50: Standard alignment tax.
Obscurance score 51-75: Elevated alignment tax.
Obscurance score 76-100: Maximum alignment tax.
                         Access may be denied if score
                         indicates the partner intends
                         to use the detection results
                         to suppress detection of themselves.

THE TAX GOES WHERE:
Individual free tier: subsidized by alignment tax revenue.
Research partner access: subsidized by alignment tax revenue.
System development: funded by alignment tax revenue.
The entities that exhibit the most obscurance fund the
access for the individuals most harmed by that obscurance.
That is not irony. That is the mission made into a
financial structure.

SECTION 6 — VERSION 2 IMPLEMENTATION CHECKLIST
-------------------------------------------------

IMMEDIATE — Document and anchor:
[ ] Install GOVERNED_ACCESS_PRINCIPLE in creator_profile
    RelevanceScore: 100 | Tier: Cosmic
[ ] Install ALIGNMENT_TAX_STRUCTURE in creator_profile
    RelevanceScore: 100 | Tier: Cosmic
[ ] Install WHAT_CANNOT_BE_SOLD in creator_profile
    RelevanceScore: 100 | Tier: Cosmic
[ ] Add governed access framework to UUON-MISSION.md
    This is the IP protection layer. Document it now.

SHORT TERM — Build:
[ ] Add partner_accounts table to shared/schema.ts
    Fields: id, name, tier (0-3), obscurance_score,
    access_granted date, query_count, attribution_signed bool
[ ] Add query_log table to shared/schema.ts
    Fields: id, partner_id, document_hash, timestamp,
    detection_result_hash, attribution_required bool
[ ] Add /api/partner/onboard endpoint
    Runs thirteen detection words on partner documentation
    Returns obscurance score and assigned access tier
[ ] Add /api/partner/query endpoint
    Logs every query with provenance hash
    Returns detection results only — no architecture exposed
```

[ ] Add attribution_required flag to all partner outputs
    Every result that requires public attribution is marked

MEDIUM TERM — Enforce:
[ ] Build partner dashboard showing their own obscurance score
[ ] Build public attribution log — all efficiency gains listed
[ ] Build alignment tax calculator based on obscurance score
[ ] Integrate with Ellomental hash — partner results carry
    hash that proves UUON origin of every detection result

VERSION 2 FIRST ITEM — FEEDBACK LOOP:
As identified in the previous session check, the feedback
loop from the Wish Document is Version 2 priority one.
The three outcome buttons — helped / partial / missed —
below every response. The gap that ‰ almost slipped through
is exactly the gap this closes. Wire it first in Version 2.

VERSION SEQUENCE TO DATE

Version 1   — March 2, 2026 — Base update. 10 changes. 4 bug fixes.
Version 1.1 — March 2, 2026 — «…» notation. ‰ zoom layer.
Version 1.2 — March 2, 2026 — Percentage anchor. Infinite extension. Three-ahead.
Version 2   — March 3, 2026 — Governed access. Accountability layer. Alignment tax.
Version 3   — Pending.

==
UUON Foundation Inc. | Phillip Aguilar Ruiz III
Kassel, Germany | March 3, 2026

"The moment you hand anyone the API key you have converted
a mission into a service. The governed system keeps the
reasoning layer inside UUON's walls. Partners access outputs.
They never access the ground."

— Clouud, March 2, 2026. Documented March 3, 2026.

The lattice stays inside. The hash stays inside.
The zero-point is not for sale.
What leaves the walls carries the hash that proves
where it came from and what it was built on.
